

# BookAnalyser

Ein Projekt in Funktionaler Programmierung / Felix Kainz

# Project Structure

- Includes.cpp
  - Hier befinden sich alle inkludierten Header und verwendeten Entities
- MapReduce.cpp:
  - Hier befindet sich die main
- PureFunctions.cpp:
  - Hier befinden sich alle Funktionen die vollständig pure sind
- ImpureFunctions.cpp
  - Hier befinden sich alle Funktionen die nicht pure sind

# Ablauf:

- 1. Einlesen des Buches

```
ifstream inputFile(filename);
vector<vector<string>> chapters;
chapters.push_back(vector<string>());

while(std::getline(inputFile, line) && !bookIsOver){
    if(line.length() == 0){
        continue;
    }

    if( bookHasStarted ){
        if(line.compare(0, 7, "CHAPTER") == 0){
            currentchapter++;
            chapters.push_back(vector<string>());
        } else {
            chapters[currentchapter].push_back(line);
        }
    }
}

inputFile.close();

return chapters;
```

## CHAPTER 1

"Well, Prince, so Genoa and Lucca are now just family estates of the Buonapartes. But I warn you, if you don't tell me that this means war, if you still try to defend the infamies and horrors perpetrated by that Antichrist--I really believe he is Antichrist--I will have nothing more to do with you and you are no longer my friend, no longer my 'faithful slave,' as you call yourself! But how do you do? I see I have frightened you--sit down and tell me all the news."

## CHAPTER 2

Anna Pavlovna's drawing room was gradually filling. The highest Petersburg society was assembled there: people differing widely in age and character but alike in the social circle to which they belonged.

# Ablauf:

- 2. Einlesen der Wortlisten

```
afraid  
anguish  
armed  
barbwire  
battle
```

- 3. Mappen der Wortlisten

```
["afraid", 1]  
["anguish", 1]  
["armed", 1]  
["barbwire", 1]  
["battle", 1]
```

Konvertierung zu einer map um:

- Effiziente Suche nach Keys
- Wenn Key  $\geq 1$  dann vorhanden
- Wenn Key = 0 dann nicht vorhanden

```
auto MapVector = [](const vector<string> Vector)  
{  
    map<string, int> Mapping;  
    for(string Word : Vector){  
        Mapping[Word]++;  
    }  
    return Mapping;  
};
```

*Image: PureFunctioncs.cpp - MapVector*

## 4. Evaluation

- 1. Iteriere über jedes Kapitel
- 2. Mache einen neuen Thread
  - Teile die Kapitel in Wörter
  - Evaluiere das Kapitel
  - Speicher dein Ergebnis
- 3. Warte bis alle Threads fertig sind
- 4. Sortiere alle Ergebnisse

```
o EvaluateAllChapters = [](const Book& Book, const map<string, int>& PeaceMapping, const map<string, int>& WarMapping )  
{  
    mutex mtx;  
    vector<ChapterEvaluation> EvaluatedChapters;  
  
    // remove the prelude before the first chapter starts  
    auto BookView = Book | std::views::all | std::views::drop(1);  
    int i = 0;  
  
    // vector of all threads  
    vector<thread> activethreads = {};  
  
    ranges::for_each(BookView.begin(), BookView.end(), [&](const vector<string>& chapter){  
        int Threadnumber = ++i;  
        // add a thread for each chapter  
        activethreads.emplace_back([&EvaluatedChapters, &mtx, &chapter, &PeaceMapping, &WarMapping, Threadnumber]() {  
            // Tokenize them  
            Chapter TokenizedChapter = SplitChapterIntoWords(chapter);  
  
            // Evaluate  
            ChapterEvaluation result = EvaluateChapter(TokenizedChapter, PeaceMapping, WarMapping);  
  
            // add index and save the result  
            result.chapterIndex = Threadnumber;  
            lock_guard<mutex> lock(mtx);  
            EvaluatedChapters.emplace_back(result);  
        });  
    });  
  
    // wait for all to finish  
    for (auto& thread : activethreads) {  
        thread.join();  
    }  
  
    // sort it  
    vector<ChapterEvaluation> EvaluatedChaptersSorted = sortEvaluations(EvaluatedChapters);  
  
    return EvaluatedChaptersSorted;  
};
```

"Well, Prince, so Genoa and Lucca are now just family estates of the

# Evaluiere das Kapitel

- Besteht aus zwei Teilen:

## 1. Filtere alle Wörter

- Gehe durch jedes Wort
- Schau ob es in einer Map ist
- Wenn ja, dann speichere es in einer Liste

Optional:

Entweder Peace Term oder War Term oder keines von beidem

```
vector<int> FoundPeaceTerms = { };
vector<int> FoundWarTerms = { };
int iterator = 1;

auto evaluateWord = [&](Word word){
    optional<int> Result = Filter(word, PeaceTerms, WarTerms);
    if(Result.has_value()){
        if(*Result){
            FoundWarTerms.push_back(iterator);
        } else {
            FoundPeaceTerms.push_back(iterator);
        }
    }
    iterator++;
};

auto evaluateLine = [&](Line line){
    for_each(line.begin(), line.end(), evaluateWord);
};

for_each(Chapter.begin(), Chapter.end(), evaluateLine);

return make_pair(FoundPeaceTerms, FoundWarTerms);
```

*Image: PureFunctioncs.cpp - FilterChapter*

```
auto Filter = [](const string& Word, const map<string, int>& PeaceTerms, const map<string, int>& WarTerms) -> optional<int> {
    if(PeaceTerms.find(Word) != PeaceTerms.end()) return 0;
    if(WarTerms.find(Word) != WarTerms.end()) return 1;
    return nullopt;
};
```

*Image: PureFunctioncs.cpp - Filter*

# Evaluiere das Kapitel

- 2. Berechne die Häufigkeit

Einfaches zählen der  
Elemente von beiden  
Listen

Das Thema mit mehr  
Elemente = das Thema  
des Kapitels

```
auto PairVectors = FilterChapter(Chapter, PeaceMapping, WarMapping);

int PeaceDistance = avrgDistance(PairVectors.first);
int WarDistance = avrgDistance(PairVectors.second);
bool isWarChapter = WarDistance > PeaceDistance;

ChapterEvaluation Result{
    0,
    Chapter,
    PairVectors.first,
    PairVectors.second,
    isWarChapter,
};
return Result;
```

*Image: PureFunctioncs.cpp - EvaluateChapter*

## 4. Evaluation

- 1. Iteriere über jedes Kapitel
- 2. Mache einen neuen Thread
  - Teil des Kapitels in Wörter
  - Evaluate das Kapitel
  - Speicher dein Ergebnis
- 3. Warte bis alle Threads fertig sind
- 4. Sortiere alle Ergebnisse

```
o EvaluateAllChapters = [](const Book& Book, const map<string, int>& PeaceMapping, const map<string, int>& WarMapping )  
    mutex mtx;  
    vector<ChapterEvaluation> EvaluatedChapters;  
  
    // remove the prelude before the first chapter starts  
    auto BookView = Book | std::views::all | std::views::drop(1);  
    int i = 0;  
  
    // vector of all threads  
    vector<thread> activethreads = {};  
  
    ranges::for_each(BookView.begin(), BookView.end(), [&](const vector<string>& chapter){  
        int Threadnumber = ++i;  
        // add a thread for each chapter  
        activethreads.emplace_back([&EvaluatedChapters, &mtx, &chapter, &PeaceMapping, &WarMapping, Threadnumber]() {  
            // Tokenize them  
            Chapter TokenizedChapter = SplitChapterIntoWords(chapter);  
  
            // Evaluate  
            ChapterEvaluation result = EvaluateChapter(TokenizedChapter, PeaceMapping, WarMapping);  
  
            // add index and save the result  
            result.chapterIndex = Threadnumber;  
            lock_guard<mutex> lock(mtx);  
            EvaluatedChapters.emplace_back(result);  
        });  
    });  
  
    // wait for all to finish  
    for (auto& thread : activethreads) {  
        thread.join();  
    }  
  
    // sort it  
    vector<ChapterEvaluation> EvaluatedChaptersSorted = sortEvaluations(EvaluatedChapters);  
  
    return EvaluatedChaptersSorted;
```

Image: PureFunctioncs.cpp - EvaluateChapters

# Sortieren alle Ergebnisse:

Std::sort sortiert die die Evaluations basierend auf Ihrer Kapitelnummer, damit sie wieder in der richtigen Reihenfolge sind.

Problem:

Kapitelevaluieren sind const und können nur kopiert werden und nicht verschoben

Lösung:

Wir sortieren Indexe, und erstellen erst ganz am Ende eine neue Sammlung

# Ergebnisse

```
1 Chapter 1: peace-related
2 Chapter 2: peace-related
3 Chapter 3: peace-related
4 Chapter 4: peace-related
5 Chapter 5: peace-related
6 Chapter 6: peace-related
7 Chapter 7: war-related
8 Chapter 8: peace-related
9 Chapter 9: peace-related
10 Chapter 10: war-related
11 Chapter 11: peace-related
12 Chapter 12: peace-related
13 Chapter 13: war-related
